

Satellite radio is the next step in the future of radio. I not only am a subscriber to satellite radio, I also install satellite systems. I find those who are not in favor of satellite radio are those who are in competition with satellite radio. They fear that if satellite radio takes over and delivers the local broadcast to areas of the nation that they will not be able to profit, however, I believe they can co-operate. The local broadcasters will broadcast via off-air locally and then via spot beams from the satellites. The local broadcasters can sell their broadcast to satellite radio companies and deliver the broadcast to the spot beamed areas of the nation. Satellite companies will need to invest more in spot beams and most likely new satellites. Satellite radio is not only a very powerful and enjoyable system it can also be very helpful.

Satellite radio allows a listener to listen to all types of music and events in digital quality sound that surpasses any off-air radio station.

Satellite radio is now finally becoming able to give listeners great information, helpful information such as weather and traffic. I drive around 150-200 miles a day 5 days a week to many areas within a 3 state radius. To have local weather, traffic and emergency information would be not only a great help but it could very well save lives. If only I had more info from my satellite radio I would feel more confident driving to all my locations. Winter time reports would make a world of difference to me and all the other people I work with and friends I now.

I would be very disappointed to find that I would not be able to have such great helpful information via my satellite radio.

Please allow the world to advance by providing satellite radio listeners the freedom of audio.
